

Predict Pro Risk Disclosure

This Risk Disclosure explains material risks of using the Predict Pro platform, its AI Agent and any prediction-market or related feature that is expressly made available. It is issued by Predict Pro Group, based in the United Kingdom (“Predict Pro”, “we”, “us” or “our”). Read it with the Predict Pro Terms of Service, the rules for each market or feature, and any information provided by the party that operates the relevant market or holds your funds.

Key warning. A real-money prediction-market position is speculative. You could lose the entire amount committed to it, as well as fees. A market price or an AI-generated probability is not a reliable forecast or a promise of a return. Do not participate with money needed for living costs or money you cannot afford to lose.

1. What this disclosure covers

Predict Pro aims to combine information about real-world events and prediction markets with AI-assisted analysis. The available experience may range from research and event tracking to participation in a market, depending on the feature actually launched and your eligibility. The risks differ across these activities. Reading market data involves information and decision risk; committing funds adds a risk of financial loss, execution problems and settlement disputes. If a feature is provided by an independent market operator, payment provider or wallet provider, its own risk disclosures and rules also apply.

Predict Pro is non-custodial and provides information and analytical tools. Unless a feature expressly states otherwise, Predict Pro does not operate a real-money market, hold customer money or digital assets, or provide an investment product. Before a transaction is available, the Platform or applicable feature rules will identify the responsible operator, the nature of the activity, and the material rules that apply.

2. Losing your full stake

An event can resolve against the position you take. Where a position is fully funded and its maximum loss is limited to the amount paid or staked, you may still lose that whole amount and associated fees. The exact amount at risk depends on the market rules and the transaction you approve. Do not assume an early exit will be available to reduce a loss. If any future feature introduces borrowing, leverage, margin, a short position or another obligation that can exceed the amount initially paid, its maximum possible loss and funding obligations must be separately and prominently explained before that feature is offered. These materials do not establish that such a feature exists.

Profits are uncertain. A series of correct predictions can be followed by substantial losses. Past results, back-tests, hypothetical examples and model outputs do not predict future results. Any money used in a market should be treated as at risk from the moment the transaction is accepted until the position is closed or settled.

3. Event and probability risk

The outcome of a future event is uncertain even when a market looks one-sided. New facts, policy decisions, injuries, revised data, unexpected participants or a last-minute change can reverse an expected result. Some event categories, including politics, sport, economic releases and cryptoassets, can move sharply on a single announcement or rumour.

A displayed market price or percentage reflects the activity and pricing method of that market, not a certified statistical probability. It can be distorted by limited participation, large orders, differing interpretations of a question, incentives, fees or manipulation. A high displayed percentage does not mean the outcome is certain. A low displayed percentage does not mean a position is cheap or good value. Compare the market wording and data source with your own understanding before acting.

4. Market wording, resolution and data sources

The exact wording of a market question matters. A title may be shorter than the operative rules. Terms such as “announce”, “approve”, “win”, “launch” or “by” may have a special definition, deadline or time zone. The rules should identify the source or method used to determine the outcome, what happens if an event is delayed or cancelled, and how a disputed or corrected result is handled. An apparently correct prediction may still lose if it does not satisfy the written resolution criteria.

Official statistics, news feeds, sports bodies, blockchain data and other outcome sources can be delayed, corrected, unavailable, compromised or inconsistent. The operator may need to suspend settlement, apply a fallback source, void a market or correct an earlier result under its published rules. This can change when or how a position is settled and may affect your account balance. Before participating, read the complete market rules and check who makes and reviews a resolution decision.

5. Liquidity, pricing and execution

Some markets have few participants or wide spreads between the prices at which people are willing to buy and sell. You may be unable to enter or exit when you want, or may have to accept a materially worse price. A displayed quote can change or disappear before an instruction is accepted. An order can remain unmatched, be partly matched, be rejected or be affected by an interruption. Fees and network costs, where applicable, can make a seemingly profitable position unprofitable.

Fast-moving events create additional risk. A stream described as live may still lag the underlying event, while other participants may have faster or better information. A stop, limit, alert or other risk-control setting may not work as expected during a system failure or market suspension. Unless an operator expressly guarantees a particular execution result under its rules, you should not rely on receiving a specific price or being able to close a position before resolution.

6. AI Agent and data risk

The Predict Pro AI Agent may organise information, summarise events, compare scenarios, estimate probabilities or identify potential market signals. AI outputs can be wrong, incomplete, biased, internally inconsistent or out of date. A model may invent a source, misread a market rule, miss a late event, confuse similarly named people or events, or present uncertainty with unwarranted confidence. Input data, third-party feeds and historical examples can contain errors or gaps. Model performance can deteriorate when circumstances change.

The agent's explanation, score or suggested action is a tool for your assessment, not proof that a market is mispriced or an outcome is likely. Check important claims against primary sources and the operative market rules. Do not infer that a proposed component, continuous-learning loop, risk-control system or partnership shown in planning material is a live safeguard. Unless a separate feature expressly permits it and you authorise it, an AI response does not place a transaction for you. If automated execution is introduced, it may create additional risks from incorrect parameters, rapid repeated orders, delayed cancellation and failed controls. Applicable permissions, limits and controls will be explained before you opt in.

7. Technology, cyber and access risk

Websites, applications, cloud services, data feeds and payment systems can fail or be attacked. You may be unable to view a market, change a position, receive an alert or access an account at a critical time. Software defects, incorrect displays, unauthorised account access, phishing and stolen credentials can cause loss or delay. Security measures reduce these risks but cannot remove them completely.

Protect your password, authentication device and any connected wallet. Verify addresses and permissions before approving a connection or transaction. We will not ask for a wallet seed phrase or private key in a prompt or

support message. Prompt content may contain confidential information; do not submit data or secrets that you are not authorised to share. Contact us if you suspect an account, wallet or data-security compromise.

8. Wallet, digital asset and payment risk if offered

Non-Custodial Platform and Wallet Disclaimer

Predict Pro operates as a non-custodial platform. Connecting a wallet to access the services does not give Predict Pro possession or control of the wallet, its private keys or seed phrase, or any digital assets associated with it. A wallet connection is used only for authentication and interaction with supported decentralised protocols.

Predict Pro does not independently initiate, authorise or execute wallet transactions on your behalf. Any transaction requires your express approval through your wallet. You remain solely responsible for, and retain sole custody and control of, your digital assets at all times.

If a feature uses a wallet or digital asset, the asset's value may change independently of the outcome of a prediction. A gain measured in an asset can be worth less when converted into pounds sterling. Blockchain transactions may be irreversible, delayed or affected by network congestion, fees, faulty smart contracts, bridge failures or incorrect addresses. A stablecoin or other asset described as stable can lose its peg or become difficult to redeem.

Different parties may control deposits, custody, transfer and withdrawal. A payment provider, exchange, wallet, custodian or independent market operator can fail, restrict access or become insolvent. The legal treatment of any held asset and the protections available depend on the exact service and provider. Do not assume that funds or cryptoassets are covered by the Financial Services Compensation Scheme or that the Financial Ombudsman Service can consider a complaint. The Platform or applicable feature rules will identify the provider and material protections for any live feature.

9. Third-party and counterparty risk

Predict Pro may show data from, link to or route a user to an independent market or other provider. That party may set the market rules, accept orders, hold assets, resolve outcomes and handle withdrawals. Its systems, finances, decisions and legal duties may differ from ours. A failure by that party can affect your position even if the Predict Pro website remains available. A logo, integration or link does not guarantee the provider's performance or create protection that its contract does not provide.

Before committing money, identify the party with whom you contract, where money or assets are held, whether funds are segregated, and the applicable complaint and recovery route. The Platform or relevant feature rules will provide material information about providers and arrangements that apply to a live feature.

10. Market integrity and information abuse

False reports, coordinated trading, wash trading, spoofing, insider information or efforts to influence the underlying event can distort prices and outcomes. Some events can be affected by a small group of people or by a data source that is vulnerable to manipulation. Surveillance or moderation cannot guarantee detection before you suffer a loss. A market may be suspended or a transaction reviewed where the operator suspects manipulation, fraud or another rule breach.

Do not trade on unlawfully obtained confidential information, try to influence a source or outcome, or circulate false claims to move a market. If a market you use is affected by suspected abuse, the applicable rules will determine whether trading, settlement or withdrawal is paused and whether a transaction is voided. Those decisions can affect a position held by a user who did not participate in the abuse.

11. Legal, regulatory and eligibility risk

The legal classification of a prediction-market feature depends on how it works and where it is offered. In Great Britain, a real-money product may fall within gambling law, while some financial products and cryptoasset activities can fall within a different regulatory framework. A company being based in the United Kingdom does not establish that every feature is licensed, authorised or available to UK consumers. Features may be unavailable in your location or to your customer category.

Law, regulatory action, a court decision or a change in an operator's permissions may require a market to be restricted, paused, cancelled or closed. It may also affect existing positions, withdrawals and the remedies available to you. The relevant operator's rules and applicable law will govern those consequences. Do not use a location-masking tool to evade a restriction.

12. Strategy, reward and referral claims

Predict Pro's planning materials illustrate possible strategy contracts, stated yields, streak bonuses and referral or rank rewards. They do not verify that any such programme has launched, that a return has been earned, or that any figure is guaranteed. A projection can depend on assumptions that fail in practice. Fees, losses, lock-up periods, withdrawal conditions, taxes and programme changes can reduce or eliminate a return. Never treat a monthly percentage or example calculation in promotional material as cash you will receive.

13. Harm from repeated participation

Frequent event markets, short deadlines, notifications and apparent near misses can encourage impulsive decisions or attempts to recover losses. A user can lose money across many small positions even when no single position seems large. If the feature is gambling, use the operator's deposit limits, time-outs, self-exclusion and other safer gambling tools. Do not borrow to participate or increase a stake to chase a loss. If participation is affecting your finances or wellbeing, stop and seek support.

Safer gambling information, self-exclusion options and support resources may be available through the relevant operator and public support services. Where a gambling feature is offered, the Platform or applicable feature rules will explain how to access the operator's controls and support resources.

14. Checks, restrictions and delays

Age and identity verification, sanctions screening, anti-money laundering checks, fraud investigations and legal requests can delay or prevent an account action, transaction or withdrawal. You may need to provide additional information about your identity or the source of funds. A restriction may arise after you have entered a position. The responsible provider should explain the process so far as it lawfully can; some investigations or reports cannot be disclosed while in progress. Any handling of money or assets must follow the applicable law and provider agreement, not an unrestricted right to confiscate them.

15. Practical steps before you participate

Identify the operator and the permissions relevant to your location. Read the complete market question and resolution rules, including the deadline, source and dispute process. Check your maximum loss, fees, settlement asset, withdrawal conditions and any third-party exposure. Treat AI outputs and market percentages as inputs to examine, not instructions. Set a budget in advance, use available limits and keep records of each transaction. If you do not understand a feature or cannot afford the potential loss, do not use it.

16. Contact and relationship to your rights

If you have questions about this disclosure or a Predict Pro feature, contact us. For a market, payment or wallet operated by another provider, use the complaint and support route identified for that service. This disclosure

explains risk; it does not remove your rights under the Terms of Service, a provider agreement or applicable consumer law, and it does not excuse a party from a legal duty it owes you.
